Junior Backend Developer

Dear Hiring Team,

I'm a backend developer who builds REST APIs in Python (Django, DRF), Node.js (Express) and Go, and ships them end to end, from the code to Docker, a GitHub Actions pipeline and a Linux server. Beyond writing features, I care about what happens when things go wrong: before I call something done, I try to break it, then write the test that proves it holds.

I've also delivered work to a client as a freelancer: an Arabic and English OCR REST API that processes PDFs and images up to 50 MB as background jobs and returns the results as Word documents. Alongside that, I built three projects that each solve a real production failure. In my billing API, eight simultaneous payments on one invoice record exactly one charge. In my import pipeline, I killed the worker halfway through a 500,000-row file and a second worker finished it with no gaps or duplicates. In my uptime monitor, a race-detector test proves one hung endpoint cannot block the healthy ones.

These projects taught me to put guarantees where they cannot be skipped, in database constraints, transactions and tests, and to treat a feature as finished only when it is deployed and verified. I hold a B.Sc. in Software Industry and Multimedia from Alexandria University, and I'm looking for a long-term role where I can contribute consistently, learn from experienced engineers and grow with the team.

Best Regards,

Khaled Shaaban
